# potato stocks

### POTATO STOCKS UP 23 PERCENT

Stocks of potatoes for all uses held in storage by growers, local dealers and processors in the fall production areas totaled a record 130.7 million cwt. on February 1, 1975, according to the Crop Reporting Board. This was 24.1 million cwt. (23 percent) more than the 106.6 million cwt. on hand January 1, 1974 and 5 percent above the previous record February 1 stocks of 1971.

For the eight <u>eastern</u> States, February 1, 1975 potato stocks of 28.0 million cwt. were 41 percent above the 20.0 million cwt. on hand a year earlier.

Stocks in the eight <u>central</u> States on February 1, 1975 at 25.9 million cwt. were 23 percent above the 21.0 million cwt. a year earlier. In the Red River Valley of North Dakota and Minnesota, quality is variable and shrinkage and loss continue above average in some storages.

Stocks in the eight <u>western</u> States totaled 76.8 million cwt., 17 percent above the 65.7 million cwt. on hand a year earlier. In most areas, potatoes went into storage in good condition and quality of remaining stocks in storage is average or better.

Disappearance from the 1974 fall crop to February 1, 1975 totaled 157.0 million cwt. (excluding Nevada), 7 percent more than the 147.3 million cwt. moved during the comparable period a year earlier.

The accumulated quantity of potatoes processed in seven major States to February 1, 1975 from the 1974 crop totaled 58.6 million cwt., slightly below the 58.8 million cwt. processed for the comparable period a year earlier.

NOTE: Stocks are defined as the quantity remaining in storage for all purposes and uses, including shrinkage and waste and other losses that occur after the date of each report. Sales of fall potatoes for all purposes generally account for about 90 percent of the total fall production, with losses due to shrink accounting for most of the remaining 10 percent. Although more than usual storage losses are expected this season due to lower quality of potatoes entering storage in some areas, no attempt is made at this date to estimate potential losses to current storage stocks.

### POTATO STOCKS QUALITY SURVEY Minnesota and North Dakota (Red River Valley)

Quality information contained in this report is based on a potato stocks survey conducted by the Statistical Reporting Service in the Red River Valley. There were 175 samples selected on a random basis that were placed in storage at the time of harvest. Reports will continue to be issued during the 1974-75 storage season indicating accumulated average grade and weight loss for potato samples removed from storage.

Samples for all varieties removed from storage before February 1, 1975 averaged fewer  $\underline{\text{U. S. No. 1}}$  (including Bs) than a year earlier. Russets showed the largest decline in quality with a current average of 45 percent U. S. No. 1 $^{\circ}$ s. This is partially the result of some storage bins being dumped and classified as 100 percent culls. Red varieties removed from storage contain 14 percent fewer No. 1 $^{\circ}$ s than when they were harvested. Samples of White varieties show minimal change from the time of harvest.

<u>Culls</u> for both White and Russet potatoes remain above year ago levels while Reds show little change from last year. Deterioration and physiological changes in potatoes while in storage now account for a three to nine percent overall weight loss. Russets at nine percent show the largest weight loss as a result of above normal breakdown while in storage.

Averages for potatoes shipped to February 1, 1974 are also shown for last year's crop. Thus, comparisons relating to change in grade from February to final can be made for the 1973 crop. In interpreting current survey indications consideration should be given to further changes that may occur in average grade and weight loss from February 1 to the end of season.
